Bangalore, Karnataka

Professional Summary

Full-Stack Developer with hands-on production experience building responsive React.js frontends and scalable Go backend systems. Proficient in React.js, Go (Golang), REST APIs, gRPC microservices, PostgreSQL, Docker, and distributed systems. Experienced in designing performant backend services, clean client-side state management, and production-grade web applications.

Technical Skills

Frontend Architecture: React.js, Zustand, Tailwind CSS, JavaScript (ES6+)

Backend Development: Go (Golang), Gin, Fiber, gRPC, Protocol Buffers (Protobuf), RESTful API Design

Architecture & Security: Clean Architecture, System Design, Concurrency (Goroutines/Channels), JWT, OAuth 2.0, RBAC

Data Structures & Algorithms: Arrays, Linked Lists, Stacks, Queues, Binary Search Trees, Heaps, Graphs (BFS/DFS), Sorting Algorithms, Hashing

Databases & Caching: PostgreSQL, Redis, GORM ORM, Schema Design, Composite Indexing, Query Optimization

DevOps & Infrastructure: Docker, Docker Compose, CI/CD (GitHub Actions), Prometheus, Grafana, Git, AWS

Version Control: Git, GitHub

Testing: Unit Testing (Go native testing package)

Projects

EliteGate API Gateway

2026

elitegateway.site

Go, Gin, net/http, Redis, PostgreSQL, gRPC, Docker, React, Zustand, Protobuf, JWT, OAuth 2.0

- Built a multi-tenant, containerized API Gateway supporting HTTP and gRPC proxying, JWT authentication, Redis-backed rate limiting, and round-robin/least-connection load balancing.
- Implemented production-grade multi-tenancy using PostgreSQL Row-Level Security for tenant isolation, per-project Redis cache namespacing, and RBAC-enforced resource scoping across all API surfaces.
- Implemented OAuth 2.0 third-party login (Google, GitHub) alongside JWT authentication, enabling secure social sign-in for tenant users.
- Built a weight-aware round-robin and least-connections load balancer, both selectable per upstream at runtime without service restarts.
- Set up a full observability stack with Prometheus metrics and Grafana dashboards, and a GitHub Actions CI pipeline for automated builds.
- Developed a React + Zustand admin portal for managing gateway routes, upstreams, and policies, supporting live configuration reloads without service restarts.

YUMZY E-Commerce Platform

2025

github.com/AbduManaam/E-Commerce.Backend

Go, Gin, Fiber, React, PostgreSQL, GORM, JWT

- Architected a production-grade e-commerce engine using Clean Architecture to isolate domains, frontend applications, and database handlers for sustainable scaling.
- Implemented channel-based concurrency controls to ensure transactional consistency during simultaneous checkout operations.
- Implemented address snapshotting at order creation — shipping details are deep-copied into an immutable record, preserving delivery info regardless of future user edits.
- Built a payment service that prevents duplicate payments, confirms transactions atomically, and handles refunds by updating both payment and order records in a single database transaction.

gRPC Authentication Microservice

2025

github.com/AbduManaam/grpc-microservices-Day-5

Go, gRPC, Protobuf, JWT, Interceptors

- Implemented a gRPC unary server interceptor that selectively enforces JWT validation, bypassing public RPCs (Login, Register) while protecting all other methods via gRPC metadata extraction.
- Defined strongly-typed service contracts in Protocol Buffers for UserService and OrderService, generating type-safe client/server stubs to guarantee schema-validated inter-service communication.

- Built a modular Go library implementing core data structures (singly/doubly linked lists, stacks, queues, binary search trees, min/max heaps) with documented time/space complexity for each operation.
- Implemented sorting algorithms (Quick Sort, Merge Sort, Heap Sort, Bubble/Insertion/Selection) and benchmarked performance across input sizes using Go's testing package.
- Built graph traversal algorithms (BFS, DFS) using adjacency-list representation and applied hash-table-based solutions to solve 15+ algorithmic problems across arrays, strings, trees, and graphs.
- Designed a CLI-based runner with unit tests validating correctness of each module.

Experience

Bridgeon Solutions LLP <i>Backend Developer</i>	Jul 2025 – Present <i>Calicut, Kerala</i>
• Engineered high-throughput RESTful APIs in Go (Gin/Fiber), optimizing handlers and connection pooling to significantly scale application capacity and ensure system stability under high concurrent load. • Designed optimized PostgreSQL schemas using GORM and composite indexing, minimizing average query latency and eliminating bottlenecks across critical data access paths. • Built concurrent background pipelines with goroutines and channels, maximizing data processing throughput while ensuring fully thread-safe execution in production. • Architected a stateless JWT authentication layer with custom middleware enforcing granular RBAC, securing internal routes with zero exploit incidents in production.	

Education

University of Calicut Bachelor of Commerce (Finance)	Jun 2021 – Apr 2024 Kerala
• Transitioned into full-stack software engineering through intensive self-directed study, building complex multi-tier projects using Go, distributed stores, and concurrent paradigms.
